

SEED

Containerized Algorithm Standard

What is Seed?

Seed creates an intuitive algorithm manifest that allows your algorithms to be easily discovered and consumed via Docker. It provides a complete definition of processing and storage requirements, related files, and potential errors.

- Compatible with almost any algorithm language including Python, MATLAB, C++, Go, Java and Node.js
- Seed-compliant algorithms can be efficiently integrated on any supportive platform such as Scale
- Easy-to-use CLI includes tools to build, test, and publish a Seed-compliant algorithm
 - Supports local testing and reuse of proven code in the cloud
